Conclusion

# Outline

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

- Security !
- Security from what ?
- Remedy ? "Lock" parts of the code.
- Lock at High Level description to avoid attackers from succeeding (resiliency).
- Results

# Security Need

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

- Intellectual Property (IP) blocks of code.
- IP blocks used for Hardware synthesis.
- Attacks - eg: Hardware Trojans, Reverse Engineering, etc.

# Security Measures: Locking/Obfuscation

HLock:  
Locking IPs at the  
High-Level  
Language

Background

Main

Results

Conclusion

- Modify parts of the hardware specification at the RTL/netlist layer.
- The parts work correctly only with another extra input being correct.
- This way, "locking" of IP blocks can be achieved.

# Problem?

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

- RTL/netlist layer security not resilient enough.
- Obfuscating constant values and branches of RTL are hard to do.
- SAT based/ Machine learning based attacks can easily extract the original design.

# Proposed Solution

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

- Perform locking/obfuscation at HLS level (C/C++ like) design.
- Previous approach exists in these lines, but do not measure resilience to attack and has more overhead.

Main

Results

Conclusion

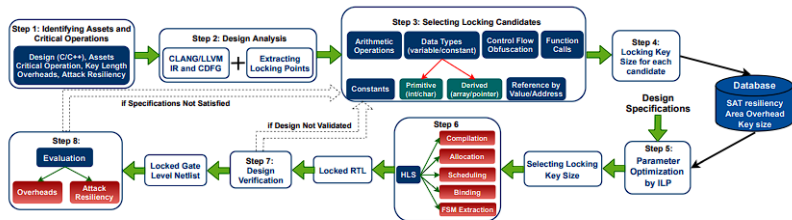

Fig. 3: The intermediate steps of HLock for hardware locking using HLS.

# Power consumption and SAT Resiliency

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

Locking Type	Mergesort		AES		NeedWun	
	Power Overhead	SAT Resiliency	Power Overhead	SAT Resiliency	Power Overhead	SAT Resiliency
inserts XOR and XNOR gates at randomly chosen locations (RND) [20]	69.09%	10.75s	35.59%	3.46s	56.47%	8.74s
inserts XOR/XNOR gates carefully to avoid fault-analysis attack (DAC) [19]	103.21%	190.20s	155%	245.50s	115.70%	156.40s
Maximizes HD between correct and incorrect outputs by MUX (ToC mux) [21]	42.10%	1.34s	67.21%	2.73s	53.39%	3.27s
Maximizes HD between correct and incorrect outputs by XOR (ToC xor) [21]	82.30%	19.34s	145.30%	26.59s	103.84%	16.23s
Minimizes low controllability locations by inserting AND, OR (IOLTS) [29]	14.67%	2.90s	13.54%	0.35s	15.74%	1.60s
<b>HLock (Proposed Framework)</b>	<b>7.84%</b>	<b>1915s</b>	<b>8.08%</b>	<b>4579s</b>	<b>8.53%</b>	<b>1883s</b>

# ML Resiliency

HLock:  
Locking IPs at  
the High-Level  
Language

Background

Main

Results

Conclusion

Benchmark Designs	Accuracy (%) for Locking Types				
	TOCm'13 [21]	IOLTS'14 [29]	SARLock [22]	Mux2 [30]	HLock
MergeSort	96.66	100	100	92.27	68.18
AES	97.22	100	100	93.82	62.50
NeedWun	98.86	99.32	100	92.74	65.87
Avg.	97.58	99.77	100	92.95	<b>65.51</b>
